

NOVA — Complete UX/UI Project Documentation

AI Customer Support Platform | End-to-End Product Design Process

Executive Summary

NOVA is a no-code AI customer support platform designed for businesses that want to deploy intelligent customer-support assistants without writing code. The product takes a business from initial setup and knowledge connection through bot configuration, deployment, conversation monitoring, analytics, integrations, and account management.

The design challenge was to make an AI-powered product feel simple and trustworthy for non-technical business users while still providing the deeper controls and analytics expected by experienced customer-support teams.

Project Snapshot

Item	Details
Primary user	Small business owners, startup founders, and customer support managers who need a simple way to automate repetitive customer questions.
Secondary user	End customers who interact with the deployed NOVA chat widget.
Market	Pakistan and the wider international business market.
Platform	Web-based SaaS product.

Design Challenge

- AI products can become overwhelming when configuration options are exposed too early.
- Small business owners need guidance and confidence rather than technical complexity.
- Support managers need deeper controls, analytics, and operational visibility.
- Customers need a fast, understandable, and trustworthy chat experience.
- The product therefore needed to balance simplicity with power.

Core Design Principles

Simple by default: Make the common path easy and keep advanced controls available without making them mandatory.

Progressive disclosure: Reveal deeper configuration only when it becomes relevant.

Trust before publish: Show connection, knowledge, status, and preview information before the user launches the assistant.

Turn data into decisions: Analytics should explain what is happening and where support can improve.

Always show the next step: Each major workflow should have an obvious primary action.

1. Research & User Understanding

The research stage established who NOVA is for, what different users need, and where an AI support product could create unnecessary friction.

Ayesha Malik — Small Business Owner (Lahore)

Goals: Set up customer support quickly; Reduce repetitive questions; Avoid technical complexity; Understand whether the AI is working

Pain points: Limited technical knowledge; Complicated configuration; Uncertainty before publishing

Design implication: Use guided onboarding, clear defaults, plain language, strong feedback, and progressive disclosure.

Hamza Ahmed — Customer Support Manager (Islamabad)

Goals: Manage support efficiently; Monitor AI performance; Understand customer conversations; Improve resolution rates

Pain points: Needs useful analytics; Requires control over AI behavior; Needs clear operational feedback

Design implication: Provide deeper controls, meaningful analytics, clear status information, and efficient workflows.

User Journey

Stage	Action	Thought	Emotion	Opportunity
Discover	Learns about NOVA	Is this relevant to my business?	Curious	Clear value proposition
Evaluate	Reviews features and pricing	Can I trust this with customer support?	Cautious	Proof, transparency, clear benefits
Sign up	Creates workspace	I hope setup is easy.	Hopeful	Short, guided onboarding
Connect	Connects website/knowledge	Did it connect correctly?	Uncertain	Visible status and feedback
Configure	Defines assistant behavior	Can I control how it responds?	Focused	Simple controls + advanced options
Test	Uses preview	Does this answer customers correctly?	Reassured	Live preview and test conversations
Deploy	Publishes assistant	Is it ready for customers?	Confident	Launch checklist and clear status

Key Research Insights

- Simple by default
- Progressive disclosure
- Trust before publish
- Turn data into decisions
- Always show the next step

2. Information Architecture

The information architecture separates the public marketing experience from onboarding and the operational product areas.

Public Experience: Landing • Features • Pricing • FAQ • Signup

Onboarding: Workspace Setup • Website Connection • Bot Creation • Knowledge Setup • Launch

Dashboard: Overview • Active Bots • Recent Conversations • Quick Actions

Bots: All Bots • Bot Builder • General • Personality • Knowledge • Conversation Flows • Appearance • Chat Preview

Conversations: Conversation List • Conversation Details • Escalations

Analytics: Conversation Volume • Resolution Rate • Common Questions • Customer Satisfaction

Integrations: Website • WhatsApp • Other Channels

Settings: Account • Team • Integrations • Billing

Primary product journey: Landing → Signup → Onboarding → Dashboard → Bot Builder → Launch

3. Wireframe Strategy

Wireframes were used to validate structure before visual styling. The focus was on hierarchy, navigation, information density, and the main user flow.

Landing: Establish the value proposition, primary CTA, navigation, feature hierarchy, pricing, FAQ, and final conversion point before visual styling.

Onboarding: Use a focused three-step flow so users know where they are, what information is needed, and what happens next.

Dashboard: Prioritize business health metrics, active bots, recent conversations, and quick actions rather than exposing every feature at once.

Bot Builder: Use a three-column workspace: configuration on the left, editable settings in the center, and a live chat preview on the right.

4. Design System

The design system creates a consistent visual language across the marketing site, onboarding, application dashboard, bot builder, analytics, settings, and chat experience.

Color Tokens

Token	Hex
Primary	#2563EB
Primary Dark	#1D4ED8
Primary Active	#1E40AF
Primary Light	#EFF6FF
Neutral 950	#0F172A
Neutral 800	#1E293B
Neutral 700	#334155
Neutral 600	#475569

Neutral 500	#64748B
Neutral 400	#94A3B8
Neutral 300	#CBD5E1
Neutral 200	#E2E8F0
Neutral 100	#F1F5F9
Background	#F8FAFC
White	FFFFFF
Success	#16A34A
Success Light	#F0FDF4
Warning	#D97706
Warning Light	FFFBEB
Error	#DC2626
Error Light	#FEF2F2

Typography

Style	Size / Line Height	Weight
Display	64 / 72	Bold
H1	40 / 48	Bold
H2	32 / 40	Bold
H3	24 / 32	Semibold
Body Large	18 / 28	Regular
Body	16 / 24	Regular
Body Small	14 / 20	Regular
Label	14 / 20	Medium
Caption	12 / 16	Regular

Layout & Spacing

4px base spacing system with an 8px primary rhythm. Desktop: 1440px, 12-column grid, 24px gutters, 80px page margins. Mobile target: 390px, 4-column grid, 16px side margins. Radius tokens: 4, 6, 8, 12, 16, 999. Shadows remain subtle.

Core Components

- Buttons — primary, secondary, tertiary, destructive; small/medium/large; hover, active, disabled, loading.
- Inputs — text, URL, search, dropdown, validation, helper text, focus, error.
- Cards — KPI cards, content cards, feature cards, bot cards.
- Badges and statuses — active, draft, resolved, escalated, needs review, connected.
- Toggles — clear on/off states with accessible labels.
- Navigation — sidebar, nav items, tabs, breadcrumbs and active states.
- Data table rows — customer, bot, topic, status, time and actions.
- Chat components — message bubbles, typing indicator, suggested questions, input and send action.
- AI/knowledge status — website connected, indexed, ready to publish, warning/error states.
- Charts — conversation volume, resolution, satisfaction and common-question visualizations.

5. High-Fidelity Product

The final interface translates the research and design system into a cohesive SaaS experience.

Landing Page: Marketing entry point explaining NOVA, its value, workflow, features, integrations, pricing, FAQ, and conversion CTA.

Onboarding — Workspace: Collect business name, website URL, and industry while showing progress through setup.

Onboarding — Assistant: Define bot name, purpose, personality, and language with a live sense of what the assistant will become.

Onboarding — Launch: Confirm website/knowledge connection, assistant configuration, preview, and readiness to publish.

Dashboard: Show total conversations, resolution rate, response time, satisfaction, active bots, recent conversations, and quick actions.

Bot Builder: Three-column workspace for general settings, personality, knowledge, conversation behavior, appearance, and live preview.

Analytics: Conversation volume, resolution rate, response time, customer satisfaction, and common questions.

Settings: Account, team, integrations, and billing management.

Chat Widget Preview: Customer-facing NOVA widget embedded in a realistic website context.

High-Fidelity Design Decisions

- Restrained blue and neutral palette to create trust without stereotypical AI visual language.
- Persistent product navigation for core areas.
- Realistic data and conversational examples.
- Three-column Bot Builder for configuration, controls, and preview.
- Analytics focused on business questions.
- Visible statuses and previews before publishing.

Mobile versions are planned for the Landing Page and Dashboard at 390px width using the same component system.

6. Prototype Plan

The prototype connects the major product journey and demonstrates how the high-fidelity screens work together.

Main Flow

- Landing → Build Your AI Bot → Onboarding Step 1
- Step 1 → Step 2 → Step 3 → Launch Assistant
- Launch Assistant → Dashboard
- Dashboard → Bot Builder / Analytics / Settings
- Bot Builder → Preview → Chat Widget Preview

Prototype Interactions

- Use Figma Prototype mode for major page-to-page navigation.
- Use On Click → Navigate To for main CTAs and sidebar navigation.
- Use Open Overlay for menus/dropdowns where appropriate.
- Use Change To for component state changes such as toggles or saved states.
- Use Smart Animate selectively; use Instant for simple navigation when it improves reliability.
- Keep the prototype focused on the core journey rather than connecting every decorative element.

Manual Completion

The final prototype connections can be completed directly in Figma Prototype mode. The high-fidelity screens provide the visual foundation; the remaining work is primarily connecting screens, overlays, and component states.

7. Final Case Study & Portfolio Story

The final presentation should tell a simple story: a complex AI product was reduced into a clear experience through user understanding, structured information architecture, a reusable design system, focused high-fidelity UI, and a connected prototype.

01 — Project Overview: NOVA is a no-code AI customer support platform that helps businesses build, customize, and deploy AI-powered customer support assistants without writing code. Businesses can connect their website and knowledge, configure their AI assistant, test conversations, launch the Chabot, and monitor its performance through a centralized dashboard.

02 — Research Summary: Before designing the interface, I focused on understanding the different needs of the people who would use NOVA.

Persona 01 — Ayesha Malik

Small Business Owner

Ayesha wants to automate customer support but does not want to deal with complicated technical configuration.

Goals

- Set up support quickly
- Reduce repetitive customer questions
- Avoid technical complexity
- Understand whether the AI is working

Pain Points

- Complicated configuration
- Limited technical knowledge
- Uncertainty before publishing

Design Need

A guided experience with clear defaults, simple language, and progressive disclosure.

Persona 02 — Hamza Ahmed

Customer Support Manager

Hamza needs more control over the AI assistant and wants useful information about how customers interact with it.

Goals

- Manage customer support efficiently
- Monitor AI performance
- Understand customer conversations
- Improve resolution rates

Pain Points

- Needs meaningful analytics
- Requires control over AI behavior
- Needs clear operational feedback

Design Need

Advanced controls and useful analytics without making the core experience complicated.

Key Research Insights

01 — Guide the beginning

Users should immediately understand what to do next.

02 — Hide complexity

Advanced options should be available without overwhelming new users.

03 — Build trust

Users need to understand what the AI knows and how it will behave before publishing.

04 — Turn data into decisions

Analytics should help businesses understand what customers need.

05 — Make setup feel fast

The onboarding experience should feel short, clear, and achievable.

03 — Information Architecture: The product architecture was structured around the complete journey of a business user.

NOVA

Public Experience

- Landing
- Features
- Pricing
- FAQ
- Signup

Onboarding

- Workspace Setup

- Website Connection
- Assistant Creation
- Knowledge Setup
- Launch

Dashboard

- Overview
- Active Bots
- Recent Conversations
- Quick Actions

Bots

- All Bots
- Bot Builder
- General
- Personality
- Knowledge
- Conversation Flows
- Appearance
- Chat Preview

Conversations

- Conversation List
- Conversation Details
- Escalations

Analytics

- Conversation Volume
- Resolution Rate
- Common Questions
- Customer Satisfaction

Integrations

- Website
- WhatsApp

- Other Channels

Settings

- Account
- Team
- Integrations
- Billing

Primary User Flow

Landing → Signup → Onboarding → Dashboard → Bot Builder → Launch

This structure keeps the most important tasks easy to access while separating advanced configuration into dedicated areas.

04 — Wireframes: The Wireframes are given in the GitHub Separate Folder; you can check the wireframes from there.

The wireframing stage focused on structure before visual styling.

The goal was to understand:

- Layout
- Information hierarchy
- Navigation
- User flow
- Content placement
- Component relationships

05 — Design System: The design system was created to maintain consistency throughout the NOVA product.

Color:

Primary: #2563EB

Primary Dark: #1D4ED8

Primary Light: #EFF6FF

Background: #F8FAFC

Neutral 950: #0F172A

Neutral 700: #334155

Neutral 500: #64748B

Neutral 300: #CBD5E1

Success: #16A34A

Warning: #D97706

Error: #DC2626

Typography:

Font: Inter

Display — 64/72 Bold

H1 — 40/48 Bold

H2 — 32/40 Bold

H3 — 24/32 Semibold

Body — 16/24

Body Small — 14/20

Caption — 12/16

Components:

The system includes reusable:

- Buttons
- Inputs
- Dropdowns
- Cards
- Badges
- Toggles
- Navigation
- Tabs
- Data tables
- Chat messages
- Status indicators
- AI/knowledge states
- Chart styles

Design Principles:

Simple by Default

Progressive Disclosure

Trust Before Publish

Data Into Decisions

Always Show the Next Step

06 — Final Screens:

8. Reflection

What the project demonstrates: The project demonstrates an end-to-end product design process: understanding users, structuring the product, establishing a reusable design system, creating high-fidelity interfaces, and connecting the core experience through a prototype.

What I learned: AI UX is not simply about adding AI features. The interface has to make the AI understandable, controllable, and trustworthy. A simple entry point can coexist with powerful configuration when complexity is progressively disclosed.

What I would improve: The next iteration should include usability testing with real businesses, validation of onboarding completion, testing of bot configuration behavior, stronger measurement of customer-support outcomes, and broader channel integrations.

Portfolio value: NOVA demonstrates product thinking rather than isolated screen design. It shows how research, information architecture, interaction design, visual systems, and prototyping work together to create a coherent SaaS product.
